

## Request for wild-collected *Lotus* material

David A. Jones

Department of Botany, 220 Bartram Hall, University  
of Florida, Gainesville, FL, 32611-2009, USA

Over the years I have collected seeds from a number of *Lotus* species in southern and south-east Europe in addition to those *Lotus corniculatus* populations I have sampled in western and northern Europe. I now need samples of seeds of *Lotus* species collected from wild populations from sites outside Europe.

I want to examine as many species and populations as I can for cyanogenesis. Although others, especially Dr. W. F. Grant, have examined many *Lotus* species for cyanogenesis, I want to check those species that, up to now, have given only negative results. It may be that they are acyanogenic in part of their range and polymorphic elsewhere.

Please send seed samples to me at the address above.

It would be helpful if you were to include some description of the location and habitat in which the plants were growing.

Due acknowledgement will be made in any publications arising from work using materials that you have supplied.
